

Abstract Dentsply-Sirona Hungary | Prof. Dr. Stefan Vandeweghe

Title: Digital in Reality: from case planning to successful clinical results

Technology has improved and fastened our clinical workflow. Virtual implant planning, guided surgery, intra-oral scanning and CAD-CAM individual abutments have merged and created a full digital workflow. But there are still some limitations. Accuracy and efficiency depend on many factors, which are sometimes out of the dentist's control. And although the merging of different scans and technologies is possible, it requires experience and knowledge of different software programs. This lecture will provide an overview and discuss the possibilities and limitations of the digitale workflow within implant dentistry.
